CS 1331 Exam 1 Practice

Name (print clearly): ________________________________________________________________

Signature: ______________________________________________________________________

GT account username (gtg, gth, msmith3, etc): _________________________________

- Signing signifies you are aware of and in accordance with the Academic Honor Code of Georgia Tech.
- Calculators and cell phones are NOT allowed.
- This is an object-oriented programming test. Java is the required language. Java is case-sensitive. DO NOT WRITE IN ALL CAPS. A Java program in all caps will not compile. Good variable names and style are required. Comments are not required.

1. True or False
In each of the blanks below, write “T” if the statement beside the blank is true, “F” otherwise.

(a) ___ A public top-level Java class may be defined in a source file with any base name as long as the file extension is .java.
(b) ___ Java identifiers can contain letters, digits, and the underscore symbol and may start with a digit.
(c) ___ The statement int x = 3f/4f; will compile, but the result will be truncated so that x gets the value 0.
(d) ___ In a for loop header, for (initializer; condition; update), the Java compiler requires initializer to initialize a loop variable and update to update it.
(e) ___ The declarations double scores[] and double[] scores are equivalent.
(f) ___ Java arrays have a variable number of elements of mixed types.
(g) ___ Given an array named scores, the statement scores[scores.length + 1] will not compile.
(h) ___ Instance methods of a class can be called without first instantiating an object of the class.
(i) ___ Every Java class has a default no-arg constructor in addition to the constructors you write yourself.
2. Expression Evaluation
   For each expression below, write the value and then the Java data type of the evaluated legal expression in the space provided. Be exact. The type you give must be the exact spelling of a Java primitive type including uppercase vs lowercase as it would appear in your program.

Expression: 7 / 2
[1] (a) Calculated value: ______________
[1] (b) Java primitive type: ______________

Expression: 64 - 16 * 2
[1] (c) Calculated value: ______________
[1] (d) Java primitive type: ______________

Expression: 2.5f + 3.0 - 1.5f
[1] (e) Calculated value: ______________
[1] (f) Java primitive type: ______________

Expression: new Double(1) / 2
[1] (g) Calculated value: ______________
[1] (h) Java primitive type: ______________

Expression: true && "Foo".equals("foo")
[1] (i) Calculated value: ______________
[1] (j) Java primitive type: ______________
3. Multiple Choice Circle the letter of the correct choice.

Given:

```java
public class Kitten {
    private String name = "";

    public Kitten(String name) {
        name = name;
    }

    public String toString() {
        return "Kitten: " + name;
    }

    public boolean equals(Object other) {
        if (this == other) return true;
        if (null == other) return false;
        if (! (other instanceof Kitten)) return false;
        Kitten that = (Kitten) other;
        return this.name.equals(that.name);
    }
}
```

Assume the following statements have been executed:

```java
Kitten maggie = new Kitten("Maggie");
Kitten fiona = new Kitten("Fiona");
Kitten fiona2 = new Kitten("Fiona");
Kitten mittens = fiona;
```

[a] What is the value of maggie?
A. the address of a Kitten object
B. null
C. automatically set to 0
D. undefined

[b] What is printed on the console after the following statement is executed?
```
System.out.println(maggie.toString());
```
A. Kitten:
B. Kitten: null
C. Kitten: Maggie

[c] What is the value of the expression fiona == mittens)?
A. true
B. false

[d] What is the value of the expression fiona.equals(fiona2) && fiona == mittens?
A. true
B. false

[e] After executing
```
Kitten[] kittens = new Kitten[5];
```
, what is the value of kittens[0]?
A. null
B. the address of a Kitten object
C. automatically set to 0
D. undefined
4. Tracing

Consider the following code:

```java
public class StrangeLogic {
    private static int counter = 0;

    private static boolean incrementCounter() {
        counter++;
        return true;
    }

    public static void main(String[] args) {
        boolean a = true, b = false;
        if (b || incrementCounter()) {
            System.out.print("Boo");
        }
        if ((a || b) && incrementCounter()) {
            System.out.print(" ya!");
        }
        System.out.println(counter);
    }
}
```

(a) What is printed when main is executed?

Consider the following code:

```java
public class AlGore {
    public static void main(String[] args) {
        String mystery = "mnerigpaba";
        String solved = "";
        int len = mystery.length();
        for (int i = 0, j = len - 1; i < len/2; ++i, --j) {
            solved += mystery.charAt(i) + mystery.charAt(j);
        }
        System.out.println(solved);
    }
}
```

(b) What is printed when main is executed?
5. Short Answer

(a) Assume you have a Java class named `Foo` that you want to be able to run from the command line. Write the header for the method you need to define in `Foo` to make it executable from the command line.

(b) Assume you are at the command line in the directory of the file that contains the definition for a Java class named `Foo`. Write the command that you would execute on the command line to compile `Foo`.

(c) If the command above executes successfully, what file will be produced?

(d) Write the command that will execute the `Foo` class you compiled above.

(e) What will the following code print?

```
for (int i = 10; i > 0; i--);
    System.out.print(''Meow!'');
```

(f) Assume you have the following start of a Student class and Student constructor. Finish the constructor. Do not change the code that is given.

```java
public class Student {
    private String name;
    private String email;
    public Student(String name, String email) {
        // Your code goes here
    }
}
```

(g) Convert the following `for` loop to an equivalent `while` loop.

```java
for (int i = 10; i > 0; i--) {
    System.out.println(i);
}
```
6. **Complete the Method**

(a) Fill in the code for the following method that takes an array of numbers and returns the number of even numbers in the array argument. Your code should use a `for` loop.

```java
public int evens(int[] numbers) {
    // Your code goes here
}
```

(b) Fill in the code for the following method that takes an array of numbers and a number and returns `true` if the array contains the number, `false` otherwise. You will need a loop, and your loop must not execute more iterations than necessary, and you cannot use `break` or `continue`.

```java
public boolean contains(int[] numbers, int n) {
    // Your code goes here
}
```
